No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Published Applications NA Main:*

ᅜ	event designated MON 88913, useful for produc
ΡŢ	cotton plant that tolerates application of glyphosate herbicide to
H	control weeds in crop.

The present sequence is the 3' transgene/genomic junction sequence of glyphosate tolerant cotton event MON 88913. This sequence is novel in cotton event MON 88913. A cotton plant and seed comprising the Sequence in its genome is an aspect of the invention. Cotton event MON 88913 was generated by an Agrobacterium-mediated transformation of cotton cells continued by an Agrobacterium-mediated transformation of cotton cells cransgene expression caseettes that each included a glyphosate tolerant 5 corton event MON 88913 having seed deposited at ATCC PTA-4854, and to progeny plants and seeds or their regenerable parts, and cotton plants are also provided for detecting the presence of DNA corresponding to cotton event MON 88913 in cample by detecting a transgency genomic junction region from cotton cample by detecting a transgency genomic junction region from cotton cused in a DNA amplification method to produce an amplicon comprising the cused in a DNA amplification method to produce an amplicon comprising the provided are methods of producing glyphosate tolerant MON 88913 in cused in a DNA amplification method to produce an amplicon comprising the provided are methods of producing glyphosate tolerant cotton plants, and amethod for determining the zygosity of the progeny of cotton event MON 89913. Also provided are methods of producing glyphosate tolerant cotton plants, and amethod for determining the zygosity of the progeny of cotton event MON 89913. Also provided are methods of producing glyphosate tolerant cotton plants, and amethod for determining the zygosity of the progeny of cotton event MON 89913. Also provided are methods of producing glyphosate tolerant cotton plants, and amethod for determining the zygosity of the progeny of cotton event MON 89913. Also provided are methods of producing glyphosate tolerant cotton plants, and amethod for determining the zygosity of the progeny of cotton event MON 89913. Also provided are methods of producing glyphosate tolerant cotton event MON 89913. Also provided are meth event MON 88913 by applying glyphosate herbicide. ×66666666666666666666666666666666666

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention describes novel glyphosate-resistant Glycine max (sugar beet) plants derived from seeds deposited as NCIMB 41158 or 41159. The invention also describes a method for identifying glyphosate-tolerant beet, cugar beet and a test kit for identifying glyphosate-tolerant sugar beet, or their cells, tissues and parts. The novel kit comprises at least one primer recognizes a foreign DNA inserted into the genome, while the second recognises DNA within a flanking (3' or 5') region. The plants are prepared by Agrobacterium-mediated transformation of sugar beet, using the vector pV-BVGT08, which contains, between right and left border sequences, a cassette containing the coding regions for (a) chloroplast transit peptide and (b) the enzyme 5-enolpyruvyl-shikimate-3-phosphate synthase (BPSPS) from Arabidopsis thaliana, under control of the figwort mosaic virus promoter and the BD-3' control of the figwort mosaic virus promoter and the BD-3' transformation event (H7 control of the figwort mosaic virus promoter and the BD-3' transcriptional terminator of Pisum sativum. One transformation event (H7 control of the fluorit to contain an insertion of a single, intext copy of the T-DNA, including the regulatory components, from pV-BVGT08. The genomic sequences outside the insert region were identical with those in a non-transformed plant and the insert was integrate stably and inherited
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  properties as regards growth, yield, quality and resistance to ogens. This sequence represents a fragment of the H7-1 transformant
                                                                                                                           glyphosate-tolerant sugar beet; chloroplast transit peptide;
5-enolpyruvyl-shikimate-3-phosphate synthase; BPSPS; H7-1 transformant;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   stably. The novel plants are highly resistant to glyphosate and retain
                                                                                                                                                                                                                                                                                                                                                                                                                                                               New sugar beet plants resistant to glyphosate, contain inserted enolpyruvyl-shikimate-3-phosphate synthase gene, which is stably
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               31.7%; Score 530.6; DB 13; Length 3706; 92.9%; Pred.                                              유
                                                        This invention describes novel glyphosate-resistant Glycine max (sugar beet) plants derived from seeds deposited as NCIMB 41158 or 41159. The invention also describes a method for identifying glyphosate-tolerant sugar beet, or their cells, tissues and parts. The novel kit comprises at least one primer pair, where one primer recognizes a foreign DNA inserted into the genome, while the second recognises DNA within a flanking (3' or 5') region. The plants are prepared by Agrobacteriuu-mediated transformation of sugar beet, using the vector pV-BVGT08, which contains, between right and left border sequences, a cassette containing the coding regions for (a) chloroplast transit peptide and (b) the enzyme 5-enolpyruvyl.

CC (a) chloroplast transit peptide and (b) the enzyme 5-enolpyruvyl.

CC shikimate-3-phosphate synthase (EPSPS) from Arabidopsis thaliana, under control of the figwort mosal or virus promocer and the EB-3'

CC characterised and found to contain an insertion of a single, inteact copy of transcriptional terminator of pisum sativum. One transformation event (H7 of the T-DNA, including the regulatory components, from pV-BVGT08. The genomic sequences outside the insert region were identical with those in casellably. The novel plants are highly resistant to glyphosate and retain cool pathogenes. This sequence represents the vector pV-GVGT08 H7-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          3615

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel recombinant DNA construct for suppression of at least one target gene. The recombinant DNA construct comprises in 5' to 3' order a promoter element operably linked to an antisense-oriented DNA element from at least one target gene and a sense-oriented DNA element, where the sense oriented DNA element is shorter than the anti-sense oriented DNA element, and sense oriented DNA element is shorter transcribed by the sense oriented DNA element, and sense oriented RNA transcribed by the anti-sense oriented DNA element, wherein the transcribed RNA forms a into a loop of anti-sense oriented DNA element, wherein the transcribed RNA forms a into a loop of anti-sense oriented RNA forms a linto a loop of anti-sense oriented RNA forms a linto a loop of anti-sense oriented RNA forms a linto a loop of anti-sense oriented RNA forms a linto a loop of anti-sense oriented RNA for suppressing the at least one target gene.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       300
                                                                 element
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          9
                                                                                                                                                                                                                                                                                                                                                        is a method for generating anti-sense oriented RNA in an organism for suppression of a target gene, comprising providing in cells of the organism a recombinant DNA construct which is transcribed to RNA that forms a loop of anti-sense oriented RNA. The methods and compositions of the present invention are useful for producing gene-suppressing loops of anti-sense RNA, and making and using constructs and transgenic plants expressing gene-suppressing loops of antisense RNA and with enhanced
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents a recombinant DNA construct of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 2947
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            3007
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     300
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      descendants expressing 5-enolpyruvylehikimate-3-phosphate synthase (cp4/epsps) enzyme activity which is obtainable by Agrobacterium mediated transformation with a gene allowing expression of cp4/epsps in plants, where the plant lacks both right and left T-DNA border sequences. The transgenic sugar beet plants of the invention are capable of tolerating herbicide treatment with glyphosate (also known as N-phosphonomethylglycine) as the active ingredient, e.g. Roundup.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention describes a novel sugar beet plant, including its descendants expressing 5-enolpyruvylshikimate-3-phosphate synthase (cp4/epsps) enzyme activity which is obtainable by Agrobacterium mediated transformation with a gene allowing expression of cp4/epsps in plants, where the plant lacks both right and left T-DNA border sequences. The transgenic sugar beet plants of the invention are capable of tolerating herbicide treatment with glyphosate (also known as N-phosphonomethyl-glycine) as the active ingredient, e.g. Roundup.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        descendants expressing 5-enolpyruvylehikimate-3-phosphate synthase (cp4/epsps) enzyme activity which is obtainable by Agrobacterium mediated transformation with a gene allowing expression of cp4/epsps in plants, where the plant lacks both right and left rDNA border sequences. The transgenic sugar beet plants of the invention are capable of tolerating herbicide treatment with glyphosate (also known as N-phosphonomethyl-glycine) as the active ingredient, e.g. Roundup. The present invention relates to a recombinant, double-stranded DNA vector, comprising a promoter functional in plant cells, and a DNA sequence from a prokaryotic organism (e.g. Escherichia coli) coding for fructose-1,6-bisphosphate aldolase (FDA), where the DNA sequence is operatively linked to the promoter in the sense orientation. FDA catalyses the conversion of triosephosphate into fructose-1,6 bisphosphate in plant chloroplasts (starch synthesis) and in the cytosol sucrose synthesis). The recombinant DNA vector of the invention is useful for producing genetically transformed plants that have elevated carbon assimilation, storage, export and improved uniformity of solids (e.g. in transgenic potatoes expressing fda). The vector of the invention is particularly useful in the commercial production of foods derived from potatoes which are useful for producing French fries. The transgenic plants exhibit increased photosynthesis rate, increased plant yield, increased prowth rate and increased solids uniformity compared with plants that do not contain the recombinant DNA vector. The recombinant DNA vector provides higher quality, more uniform potator regions, and therefore french fries. This results in a higher throughput in the French fry processing plant due to lower processing times, and processor cost savings due to lower processing times, and processor cost savings due to lower processing times, and processor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       y input required for lower blanch, dry, sequence represents a plant transformation

                                                                                                                                                                                                                                               300
                                                                                                                                                                                                                                                                   Fructose-1,6-bisphosphate aldolase (FDA) catalyses the reversible reaction converting triosephosphate into fructose-1,6-bisphosphate aldolase. By inserting triosephosphate into fructose-1,6-bisphosphate these vectors and inserting the FDA gene into expression vectors and inserting the FDA gene into expression of the FDA enzyme production can be achieved. Increasing the expression of the FDA enzyme in the chloroplast increases carbon assimilation and results in an increase in chloroplast starch production. This increase in carbon assimilation is a desirable trait in crop plants and leads to increased plant growth, storage ability, yield, vigour, and stress tolerance. Increasing FDA expression in the cytosol of photosynthetic cells leads to an increase in sucrose production. The transgenic plants containing the recombinant DNA can have increased photosynthesis rates, increased
                                                                                                                                                                                 240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Use of fructose-1,6-triphosphate aldolase DNA - useful for, e.g. producing transgenic plants with increased photosynthesis rates, increased growth rates and improved solids uniformity.

yields, increased growth rates and improved solids uniformity compared with plants that do not contain the recombinant DNA molecule. Vectors containing the recombinant FDA gene are used particularly for improving potato products. This sequence describes the vector designated pMON17524 which comprises the E.coli FDA gene fused to the Arabidopsis small
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Use of fructose-1,6-triphosphate aldolase DNA - useful for, e.g. producing transgenic plants with increased photosynthesis rates, increased growth rates and improved solids uniformity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Fructose-1,6-bisphosphate aldolase; FDA; carbon assimilation; starch; sucrose; crop; yield; growth; transgenic plant; potato; photosynthesis;

Fructose-1,6-bisphosphate aldolase (FDA) catalyses the reversible reaction converting triosephosphate into fructose-1,6-bisphosphate aldolase. Is aldolase. By inserting the FDA gene into expression vectors and inserting these vectors into the chloroplasts of plant cells, increased starch chase vectors into the chloroplast increases carbon assimilation and results in an increase in chloroplast starch production. This increase in carbon assimilation is a desirable trait in crop plants and leads to increased in chloroplast starch production. This increase in carbon assimilation is a desirable trait in crop plants and leads to increased in sucrose production. The transgenic plants containing the an increase in sucrose production. The transgenic plants containing the crombinant DNA can have increased photosynthesis rates, increased containing the recombinant DNA molecule. Vectors containing the recombinant FDA gene are used particularly for improving pertato products. This sequence describes the vector designated pWON17542 which comprises the E.coli FDA gene fused to the Arabidopsis small subunit CTP1 and the Arabidopsis EPSPS (CTP2) transit peptide. This
